

# Strict Physical Law

*By Vincent Sargenti*

Someone once said that the whole world is full of shit, covered with shit and that the worlds itself was going into the shitter. We've ALL really been wantin' to go out and git some more shit! Some NICE shit! Well, there's a buncha shit I need. Ya know, George Carlin once said that a home is just a place where you keep your shit while you're out getting more shit! And I think he's right!!! You know when you get all new shit you gotta make sure it's the GOOD shit, ya know what I'm sayin'? Ya scratch my drift? Ya feel me?

All right! Now sometimes yer shit gets old and you find out that somebody just built some nice, new shit and put it on the market. You go see the new shit, and it's all fresh and wet lookin' and shiny... sparkling under the showroom lights? Then you get home and you see your same old shit sitting there and your lookin at it thinkin, "Damn! I need some new shit! This shit is all fucked up!" And no body likes to have their shit fucked up. That's bullshit, ya know?

So you start thinking about all the ways you can scrape up enough cash to buy some more shit! New shit, nice shit, top-of-the-line SHIT! So once you get it, you tell people, "Hey! Don't fuck with my shit!" And if they leave their shit at your house for too long you say, "Hey man! What is this shit? Get this shit out of here. Come git yer shit!"

And if they don't come get it, you tell 'em, "I ain't gonna take this shit!" I don't have room for your shit cause I gotta put my old shit here. I gotta bunch of new shit and I gotta have room to store my old shit." You can take a shit, you can give people shit, you can fuck shit up and you can even talk shit! Shit, my friends is definitely what the world is made of. The world is full of shit! All kinds of shit!

All living organisms are like little self-contained shit factories! We process our environment bit-by-bit, shit-by-shit, through our selves and we turn it into shit. It is a strict biological law of physics. Even the tiniest of living cells make shit, and in time populations of cells, legions upon legions, nations upon bacterial nations rise and fall. All in the balance of transforming their environments into shit!

Why should we be any different? We buy shit, we try shit, we drink shit, we smoke shit, we clean shit, we wash shit and wrap shit, we write shit and we flush shit! We find a great restaurant and we say, "Maaan, this is some really great shit!" And in retrospect, yes, it definitely is.

We process our environment, in our case the entire world, our planet and we are turning everything into shit, just as the cells in the petre' dish. And when the environment is no longer food rich but "shit-rich" our populations will wain and we will die off. It is simply the strict physical laws of shit!

Enjoy your world while it lasts! Tomorrow this could all turn to shit!
